DBC Migration Monitor

Meteora DBC graduation and DAMM v2 pricing tools

Michael Owusu | O-Enterprises | London

Existing internal prototype; developer-facing package in preparation

Crypto World's Fair - Meteora DBC track

Target: 10,000 USDC first prize

Prepared 2 October 2026. Competition entry materials; no award or submission is claimed.

The developer problem

A migration event is only the beginning of a reliable integration

Launchpad and terminal builders need to connect a completed DBC curve to the right DAMM v2 pool.

Fast transaction feeds can include failed transactions or miss routed activity. Replaying every observed transaction can give the wrong state.

Our internal research shifted pricing to account-state updates and retained explicit unsupported and missing-evidence outcomes.

Observed engineering problem in our own prototype. Broader customer demand still needs validation.

Existing technical foundation

The Meteora integration is already implemented in the internal system

Component	Existing implementation
DBC graduation	Migration feed, admission checks and pool-role matching
Keeper ticket	Supported pre-graduation state prediction and binding
DAMM v2 pricing	Integer quote math with explicit supported scope
Pool updates	Yellowstone account stream and RPC cross-checks
Traceability	Recorded decisions, execution journal and reconciliation

Source inspected locally. These components are not yet a separately released SDK or public API.

Recorded validation

200 sampled updates in a 120-second archived check

Comparison	Matched	Other outcomes
Stream state vs chain event	166	33 unavailable; 1 without a swap event
Swap math within those 166	132	14 N/A; 16 unsupported; 4 partial fills skipped

No mismatches appear in the retained aggregate summary. The exclusions are part of the result, not successful comparisons.

Evidence: evidence/stream_vs_chain_20261001.json. Recorded internal results; not independently rerun for this package.

Meteora track fit

A developer-tooling entry built around DBC and DAMM v2

The track explicitly invites data streams and developer tools for launchpads and trading terminals.

Our proposed product exposes migration context and supported pool pricing with traceable inputs and clear limitations.

The first users we would approach are Meteora launchpad builders and terminal developers. No external pilots or paying customers are claimed.

Track brief: https://superteam.fun/earn/listing/meteora-dbc. Product positioning and customer targets are proposals.

Development history and limits

A substantial existing foundation, with recent work disclosed separately

Before 14 September: DBC/DAMM v2 research and core infrastructure already existed.

October 1-2 reports: ticket integration, streamed-state pricing, comparison evidence and execution-latency work.

Internal mainnet trials include losses. Fast quotes and migration evidence do not establish profit, token safety or prevention of liquidity removal.

Processed account updates can change before finality. Supported arithmetic is narrower than the full Meteora feature set.

Colosseum requires disclosure of prior work and judges competition-period development. Report dates are not independent commit-history proof.

Proposed use of 10,000 USDC

Eight weeks to make the existing work easier to review and integrate

Workstream	USDC
Reusable interfaces, documentation and examples	4,000
Fixture corpus and reproducible validation	2,000
Bounded data infrastructure and hosting	1,500
Independent review and licensing work	1,500
Developer pilots and integration support	1,000
Total	10,000

Planning allocation only, contingent on an award. No trading capital, guaranteed outcome or existing supplier commitment.

Reviewer path and next release

Start with the bounded evidence, then review the implementation

This package includes the technical brief, aggregate evidence and a small offline consistency check.

The next release would provide a clean reviewer repository, supported-layout documentation and recorded fixture demonstrations.

Source access and public presentation links remain to be arranged. The offline check is an evidence walkthrough, not a live product demonstration.
